

Lab Task:

You are hired by a university's software department to build a system that manages student profiles. The system should store a student's personal details, academic record, and determine if the student is eligible for a scholarship based on their performance

First create three classes.

1. Person class

Data Members	Name	Age
Member Functions	Set person Detail	Display Person detail

2. AcademicRecord class (Inherit from Person)

Data Members	GPA	Major
Member Functions	setAcademicDetails()	displayAcademicDetails())

3.

Scholarship class (Inherit from both classes)

Data Members	scholarshipAmount
Member Functions	Evaluate Scholarship

Logic: If $GPA \geq 3.5$ and $age < 25$, assign 50000 as scholarship. Otherwise, assign 0

- **displayScholarshipDetails()**
